summer pack

Grass will continue to grow throughout the summer, provided there is enough rain to do so. If rain is sparse, it is important to water your lawn regularly to help it survive drought conditions. Your Summer Pack products will provide a drip feed of nutrition to aid the growth and stress resistance throughout the season.

Summer Maintenance Tips

Water: Lawns should be watered thoroughly once or twice a week. This encourages deeper root growth. Water early in the morning to minimise evaporation and risk of scorching from the sunlight.

Mow higher: By cutting higher when you mow your lawn, you help to shade the soil. This reduces moisture loss and helps prevent grass from turning brown. Mow weekly and never remove more than a third of grass height at once.

Wetting agent: In drought conditions the soil can become water repellent, and the roots will have less water to uptake. A wetting agent will help break down this waxy layer to allow deeper penetration and aid water retention.

Weed control: It is highly recommended to control weeds in all seasons where the conditions are right for growth. It is important to remove weeds before flowering and seeding to prevent more weed growth the following year.

Visit progreen.co.uk to shop **wetting agents** and **selective weed control** to assist you in your maintenance this summer.

A1Lawn Ultimate Slow Release Lawn Fertiliser

2.5kg (covers up to 100m²)

Key benefits:

Contains magnesium and iron to support chlorophyll production and keep the lawn a rich green. Includes calcium to strengthen grass cells, improve resistance to stress and disease, and help nutrients move through the plant.

How to apply:

Spread evenly at 25-35g/m², ideally using a spreader for the best coverage (hand-spreading is fine - just aim for even distribution).

For best results, apply before rain so the granules wash into the soil.

If it doesn't rain within 24 hours, water the lawn daily until the granules dissolve to avoid scorching.

Apply from June - August

A1Lawn Ultimate Lawn Seaweed Extract

500ml (covers 100m²)

Key benefits:

After fertilising, you can boost lawn health with this liquid seaweed biostimulant. It helps strengthen roots, improves stress and disease resistance, and provides a small top-up of nutrients and trace elements.

How to apply:

Mix 50ml with 2.5L of water to cover 10m². Apply using a handheld pressure sprayer or watering can with a fine rose head.

Safe to apply every 2 weeks.

Apply from June - August
